

🎯 **at the fixed point** $y = y^*$, the planner optimum, *exactly* (Thm. 5.1); the profile is then an *exact* Nash equilibrium of the corrected game (Thm. 5.2(i)). **Settlement** adds the deviation's induced marginal emissions to the reported footprint, $\chi_i = \sum_t [(\mathcal{M}EF_t - \mathcal{A}EF_t) + \beta_t \hat{y}_t](x_{it}^{\text{real}} - x_{it}^{\text{cmt}})$, signed and verifiable from metering: **no money moves, and no schedule is disclosed.**
